HR Report

Profil that are the most likely to leave

This report is intended for our HR department to indetify which employee profil is the most likely to leave the company.

Dataset

Dimensions

The dataset is made of 10,000 rows about the past and current employees each row has 11 attributes which are the following :

Variables

Description

Variable	Description	Type	Why
`id`	Employee unique identifier	Quantitative	Tracks records
`satisfaction_level`	Employee satisfaction score	Quantitative	Measures morale
`last_evaluation`	Employee last evaluation score	Quantitative	Assesses performance
`number_project`	Employee number of project is involved in	Quantitative	Gauges workload
`average_monthly_hours`	Employee average monthly hours	Quantitative	Measures time input
`time_spend_company`	Employee time spent in the company	Quantitative	Tracks tenure
`work_accident`	Tells if the employee had a work accident	Qualitative	Records safety
`left`	Tells if the employee left the company	Qualitative	Target churn metric
`promotion_last_5years`	Tells if the employee was promoted in the past 5 years	Qualitative	Tracks advancement
`department`	Employee department	Qualitative	Groups organization
`salary`	Employee salary category	Qualitative	Categorizes pay

Target The target variable of the dataset is “left”, it tells us if the employee has left the company. This variable is qualitative. # TODO: Fournir une description de la variable cible et de sa distribution.

Not useful for the analysis The id variable has no purpose in the analysis because it is just an identifier that has no meaning and is strictly technical.

Relevant attributes for the analysis The work accident variable seems to be an important factor of an employee leaving the company. The department variable seems to be an important factor of an employee leaving the company. The salary variable seems to be an important factor of an employee leaving the company although there’s not much employees in the “high” salary category, which moderate the interest of that attribute for the analysis.

Less relevant attributes for the analysis The promotion in the last 5 years variable seems to be an important factor of an employee leaving the company or not although very few employees were promoted in the past 5 years. It makes the attribute less relevant for the analysis.
